Homework – Workflow for Solo Devs and Small Teams – Day 2

1. Create a new repository for one of your own projects.

2. In your notebook of problems that you started yesterday, create a list of "similar" clients that might benefit from having a single repository.

3. Explore the four vagrant scripts discussed in class.

1. Create a new folder: Workflow (mkdir Workflow)
2. Move into the folder Workflow (cd Workflow)
3. git clone https://github.com/myplanetdigital/vagrant-ariadne.git
4. git clone https://github.com/eaton/vagrant-chef-dlamp.git
5. git clone https://github.com/msonnabaum/drush-ci-chef.git

6. List the files in the current directory (dir or ls)

Workflow ->
    vagrant-ariadne
    drush-ci-chef
    vagrant-chef-dlamp

Download the fourth Vagrantfile from drupal.org
7. In a browser: http://drupal.org/project/vagrant
8. Click on the tab "version control"
9. Copy the first line of instructions under the heading "setting up the repository for the first time"
10. paste that line into your command prompt or terminal window
git clone --recursive --branch 7.x-1.x http://git.drupal.org/project/vagrant.git

If you are using windows:
Start menu → Git → Git GUI → Clone Existing Repository
Match the target directory with the source location git repo file name.
e.g. drush-ci-chef.git → drush-ci-chef
